

# AI READY COLOMBO

Practical AI skills for a changing world.

## AI JOB SEARCH TOOLKIT

Use AI to prepare better without inventing a stronger version of yourself.

# Use AI to understand the job before you start rewriting yourself

A job description is often packed with repeated phrases, broad responsibilities and a long wish list. AI can help you sort it out, but the comparison should still be based on what you have actually done.

## Pull out the real requirements

Ask AI to separate must-have skills, useful extras, responsibilities and repeated themes. Then check the original job description yourself.

## Translate vague wording

If a phrase is unclear, ask what it could mean in day-to-day work and what evidence an entry-level applicant might use to show it.

## Find your evidence

Compare each requirement with real examples from coursework, volunteering, internships, projects, societies or previous work.

## Spot the gaps

If you do not have evidence for something, leave it as a gap. Do not ask AI to write around it as if you already have the skill.

## Prompt: break down a job description

Context: I am applying for an entry-level role. Here is the job description: [paste].

Task: Break it down into the main skills, responsibilities and evidence the employer is likely looking for.

Constraints: Do not assume I have any of these skills yet. Do not add requirements that are not in the description.

Output: Give me a table with Requirement, Why it matters, and Evidence I could look for in my own experience.

**The goal is not to look perfect for every requirement. It is to show the strongest honest match you can.**

# Let AI improve the wording, not invent the evidence

|                   |                                                                                                             |
|-------------------|-------------------------------------------------------------------------------------------------------------|
| <b>1. READ</b>    | Understand the role before changing your CV. What is the employer actually asking for?                      |
| <b>2. MATCH</b>   | Compare the role with your real experience. Find evidence you already have.                                 |
| <b>3. DRAFT</b>   | Use AI to improve structure and wording without adding experience, skills or results you do not have.       |
| <b>4. CHECK</b>   | Read every line. Remove generic claims, invented metrics and anything you could not defend in an interview. |
| <b>5. PREPARE</b> | Use the final job description and your real application to practise likely interview questions.             |

## Good uses of AI on a CV

|                                                                                                                                           |                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Tighten a bullet</b><br>Make a real achievement easier to read while keeping the facts, scale and result exactly as you provided them. | <b>Match the language</b><br>Use relevant wording from the job description where it accurately describes your experience. |
| <b>Reduce repetition</b><br>Find repeated verbs, filler phrases and long sentences that can be simplified.                                | <b>Find missing evidence</b><br>Ask which claims sound unsupported so you can add a real example or remove the claim.     |

### Prompt: improve a CV bullet without exaggerating

Context: This is my original CV bullet: [paste]. The role I am applying for is [role].

Task: Make the bullet clearer and more relevant to the role.

Constraints: Do not invent numbers, responsibilities, tools, outcomes or achievements. Keep the meaning accurate.

Output: Give me three options, from most direct to most polished.

**Never keep an AI-written claim that you would struggle to explain, prove or defend in an interview.**

# Practise with the application you actually submitted

Interview practice works best when it is tied to the job description and the real examples on your CV. Use AI to create pressure and feedback, not to script a personality.

## Question practice

Ask for one question at a time. Answer first. Then get feedback on whether your answer was clear, specific and relevant.

## Evidence practice

Give AI a real project or experience and ask what follow-up questions an interviewer might use to test your contribution.

## Company research plan

Ask what you should verify about the organisation, role and industry. Then do the actual research using reliable current sources.

## Questions for the employer

Use AI to brainstorm questions, then choose the ones you genuinely care about and could ask naturally.

## Prompt: run a realistic interview practice

Context: I am applying for [role]. Here is the job description: [paste]. Here are the relevant parts of my CV: [paste].

Task: Interview me for the role.

Constraints: Ask one question at a time. Base follow-ups only on information I have provided. Do not write my answer for me before I respond.

Output: After each answer, give short feedback on relevance, evidence and clarity, then ask the next question.

## Final application check

- ☐ Every skill and achievement on my application is true.
- ☐ Any numbers or results are ones I can explain and support.
- ☐ The wording sounds like me, not like a generic template.
- ☐ I checked names, dates, company details and role titles myself.
- ☐ I know which parts of the role are a strong match and which are still gaps.
- ☐ I could discuss every important claim in an interview without needing AI to rescue the answer.

**Use AI to prepare a clearer application. Do not use it to create a candidate who does not exist.**
